Blue Watercare station

WHAT IS IT?

The Blue Watercare Drinkstation is not a traditional drinking trough. It is a complete drinking-water management system that combines clean water, calm individual drinking spaces and fully automated watercare.

WHAT DOES IT DO?

Clean drinking water

The Drinkstation is designed to actively combat contamination such as feed residues, mucus, and biofilm. The drinking water is kept in continuous motion and treated with UV-C.

Calm drinking

Three individual drinking positions provide each cow with a quiet place to drink, without disturbance from other cows.

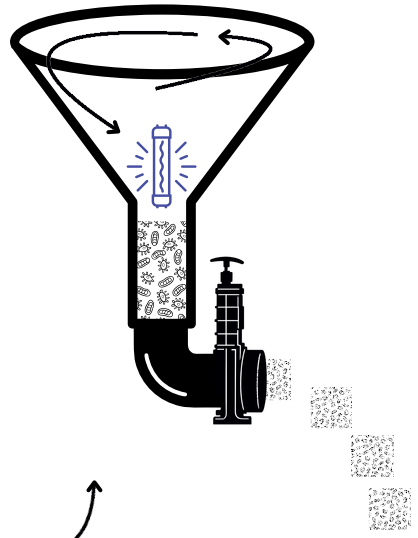

24/7 WATER TREATMENT

Even when you're not around, the Blue Watercare Drinkstation works 24/7 to maintain drinking-water quality. Water movement, debris removal, and UV-C treatment continuously work together to reduce bacterial pressure and enrich the water with oxygen. The germ count is lowered to below the GD standard for 'good drinking water', which is 10,000 CFU/ml.

HOW DOES IT WORK?

Less cleaning work

Thanks to its funnel-shaped design, dirt has no chance to settle on the walls of the drinking station. The continuous waterflow and UV-C light ensure that debris is directed towards the collectionpoint. When the valve is opened, this dirt is flushed away. As a result, you spend less time on maintenance and have more time for other tasks.

WHAT DOES IT DELIVER?

A calm drinking spot
To allow cows to drink undisturbed and in sufficient quantity.

Good water intake
Supports feed intake and thereby improves milk production.

No chemicals
Environmentally conscious.

24/7 water care
Drinking-water management that continues even when you are busy with other tasks.

Clean and fresh drinking water
Low-bacteria, oxygen-rich watersupports a healthy foundation.

Directed debris removal
Less manual cleaning work.

Better animal health
Lower veterinary costs and reduced medication use.
